

Site Plan

Restoration garden area to house north and east. Native sedge dog run to south, productive areas and remote fire pit to west.

1

Surrounding Context

The Kitsap peninsula has been heavily logged in the past century, and this project site was clear cut 20-30 years ago. The surrounding maturing forest heavily influenced our approach, because how could our design compete with that?

This concept sketch shows our intention to use planting and simple mulch paths to play against the crisp architecture, and begin to blend the garden space into the surrounding environment

Planting In Process

We primarily used bareroot plants. This is typical of restoration projects and uncommon in residential garden settings. Bareroots typically start at a smaller size than a typical potted plant, but for many species this is ideal for better rooting establishment.

Productive gardens and habitat pond

The owners have shown incredible homesteady enthusiasm at building out the productive gardens, orchard, shade structure and more.

View from spa deck

Roof Garden

Climb to the roof garden for a view of the Olympic mountains and a vista over the growing forest. A palette of mostly native species do well in this thin substrate.

Planting into Logs

Logs were brought back on site as a reference to the lands past and to become nurse logs in the succession process.
